

CLAIMS

I claim:

1. A device for rotating a floatable candle, comprising:
a first magnetic member for attaching to a base of said candle;
a transparent container for holding water for floating said candle;
a base under said transparent container; and
a second magnetic member positioned inside said base and rotated by a motor for rotating said candle by magnetic coupling between said first magnetic member and said second magnetic member.
2. The device for rotating the floatable candle of claim 1, wherein said first magnetic member is comprised of a steel clip for clipping onto a bottom of said candle, and said clip is comprised of spring claws projecting up from a plate, said claws are flexible inward and outward to accommodate candles of different sizes.
3. The device for rotating the floatable candle of claim 1, wherein said second magnetic member comprised of magnets eccentrically mounted on a spindle attached to said motor.
4. The device for rotating the floatable candle of claim 1, further including a decorative cover positioned around base, wherein said decorative cover is comprised of a circular sleeve with an open bottom, and an opening on a side to expose controls on said base.
5. A candle device, comprising:
a floatable candle comprised of an open-top housing with a fuel inside and a wick in said fuel;
a first magnetic member attached to a base of said candle;
a transparent container for holding water to float said candle;
a base under said transparent container; and

a second magnetic member positioned inside said base and rotated by a motor to rotate said candle by magnetic coupling between said first magnetic member and said second magnetic member.

6. The device for rotating the floatable candle of claim 5, wherein said first magnetic member is comprised of a steel clip clipped onto a bottom of said candle, and said clip is comprised of spring claws projecting up from a plate.

7. The device for rotating the floatable candle of claim 5, wherein said second magnetic member comprised of magnets eccentrically mounted on a spindle attached to said motor.

8. The device for rotating the floatable candle of claim 5, further including a decorative cover positioned around base, wherein said decorative cover is comprised of a circular sleeve with an open bottom, and an opening on a side to expose controls on said base.

9. A candle device, comprising:

a floatable candle comprised of an open-top housing with a fuel inside and a wick in said fuel;

a first magnetic member attached to a base of said candle, wherein said first magnetic member is comprised of a steel clip clipped onto a bottom of said candle, and said clip is comprised of spring claws projecting up from a plate;

a transparent container for holding water to float said candle;

a base under said transparent container; and

a second magnetic member positioned inside said base and rotated by a motor to rotate said candle by magnetic coupling between said first magnetic member and said second magnetic member, wherein said second magnetic member is comprised of magnets eccentrically mounted on a spindle attached to said motor.
